

人工智能实践：Tensorflow笔记

曹健

北京大学

软件与微电子学院

- ✓ **全连接NN**: 每个神经元与前后相邻层的每一个神经元都有连接关系, 输入是特征, 输出为预测的结果。

参数个数: $\sum_{\text{各层}} (\text{前层} \times \text{后层} + \text{后层})$

\downarrow \downarrow
w b

第一层参数:
 784×128 个w + 128个b

第二层参数:
 128×10 个w + 10个b 共101770个

实际项目中的图片多是高分辨率彩色图

=

灰度图单通道

彩色图红绿蓝三通道

待优化的参数过多容易导致模型过拟合

实际应用时会先对原始图像进行特征提取
再把提取到的特征送给全连接网络

原始图片

若干层特征提取

全连接网络

卷积

Convolutional

- 卷积计算可认为是一种有效提取图像特征的方法
- 一般会用一个正方形的卷积核，按指定步长，在输入特征图上滑动，遍历输入特征图中的每个像素点。每一个步长，卷积核会与输入特征图出现重合区域，重合区域对应元素相乘、求和再加上偏置项得到输出特征的一个像素点。

输入特征是单通道

卷积

Convolutional

- 卷积计算可认为是一种有效提取图像特征的方法
- 一般会用一个正方形的卷积核，按指定步长，在输入特征图上滑动，遍历输入特征图中的每个像素点。每一个步长，卷积核会与输入特征图出现重合区域，重合区域对应元素相乘、求和再加上偏置项得到输出特征的一个像素点。

输入特征图的深度（**channel**数），决定了当前层卷积核的深度；

当前层卷积核的个数，决定了当前层输出特征图的深度。

输入特征是三通道

卷积 Convolutional

- 卷积计算可认为是一种有效提取图像特征的方法
- 一般会用一个正方形的卷积核，按指定步长，在输入特征图上滑动，遍历输入特征图中的每个像素点。每一个步长，卷积核会与输入特征图出现重合区域，重合区域对应元素相乘、求和再加上偏置项得到输出特征的一个像素点。

本讲目标：用**CNN**实现离散数据的分类（以图像分类为例）

卷积计算过程

感受野

全零填充（Padding）

TF描述卷积计算层

批标准化（Batch Normalization, BN）

池化（Pooling）

舍弃（Dropout）

卷积神经网络

cifar10数据集

卷积神经网络搭建示例

实现LeNet、AlexNet、VGGNet、InceptionNet、ResNet五个经典卷积网络

✓ 感受野 (Receptive Field)：卷积神经网络各输出特征图中的每个像素点，在原始输入图片上映射区域的大小。

设输入特征图宽、高为 x ，卷积计算步长为1

参数量： $9+9=18$

参数量：25

计算量： $18x^2 - 108x + 180$

计算量： $25x^2 - 200x + 400$

当 $x > 10$ 时，两层 3×3 卷积核 优于 一层 5×5 卷积核

5x5x1 padding

3x3x1

5x5x1

全零填充

Padding

$$\begin{aligned}
 &(-1)*0+0*2+1*1 \\
 &+(-1)*0+0*9+1*5 \\
 &+(-1)*0+0*2+1*3
 \end{aligned}$$

输出图片边长= 输入图片边长 / 步长 +1=10

此图: $5 / 1 = 5$

全零填充 Padding

$$padding \begin{cases} SAME \text{ (全0填充)} & \frac{\text{入长}}{\text{步长}} \text{ (向上取整)} \\ VALID \text{ (不全0填充)} & \frac{\text{入长} - \text{核长} + 1}{\text{步长}} \text{ (向上取整)} \end{cases}$$

TF描述全零填充

用参数padding = 'SAME' 或 padding = 'VALID'表示

5x5x1 padding

3x3x1

5x5x1

5x5x1

3x3x1

3x3x1

输出宽或高: $\frac{5}{1} = 5$

$$\frac{5-3+1}{1} = 3$$

SAME: 5x5x1 \Rightarrow 5x5x1

VALID: 5x5x1 \Rightarrow 3x3x1

✓ TF描述卷积层

tf.keras.layers.Conv2D (

filters = 卷积核个数,

kernel_size = 卷积核尺寸, #正方形写核长整数, 或 (核高h, 核宽w)

strides = 滑动步长, #横纵向相同写步长整数, 或(纵向步长h, 横向步长w), 默认1

padding = “same” or “valid”, #使用全零填充是“same”, 不使用是“valid” (默认)

activation = “relu” or “sigmoid” or “tanh” or “softmax”等, #如有BN此处不写

input_shape = (高, 宽, 通道数) #输入特征图维度, 可省略

)

model = tf.keras.models.Sequential([

Conv2D(6, 5, padding='valid', activation='sigmoid'),

MaxPool2D(2, 2),

Conv2D(6, (5, 5), padding='valid', activation='sigmoid'),

MaxPool2D(2, (2, 2)),

Conv2D(filters=6, kernel_size=(5, 5), padding='valid', activation='sigmoid'),

MaxPool2D(pool_size=(2, 2), strides=2),

Flatten(),

Dense(10, activation='softmax')

])

批标准化

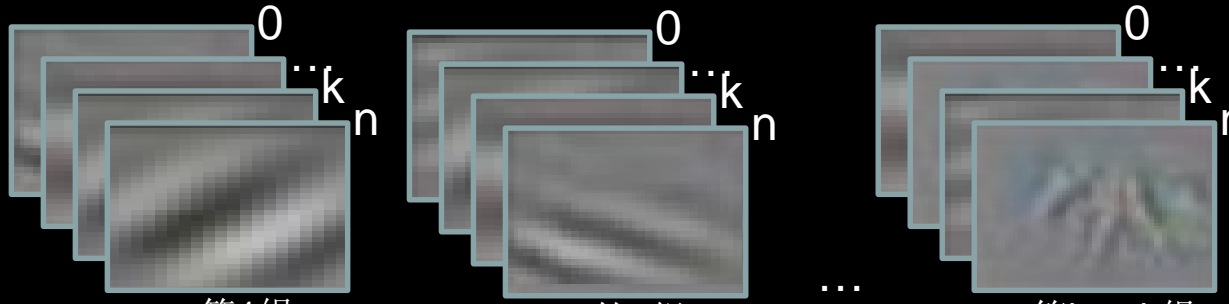

BN

批标准化 (Batch Normalization, BN)

标准化: 使数据符合0均值, 1为标准差的分布。

批标准化: 对一小批数据 (batch), 做标准化处理。

批标准化后, 第 k 个卷积核的输出特征图 (feature map) 中第 i 个像素点

$$H_i^k = \frac{H_i^k - \mu_{\text{batch}}^k}{\sigma_{\text{batch}}^k}$$

第1组 第2组 ... 第batch组

n 个卷积核, 一共有batch组输出, 每组深度都是 n

H_i^k : 批标准化前, 第 k 个卷积核, 输出特征图中第 i 个像素点

μ_{batch}^k : 批标准化前, 第 k 个卷积核, batch张输出特征图中所有像素点平均值

σ_{batch}^k : 批标准化前, 第 k 个卷积核, batch张输出特征图中所有像素点标准差

$$\mu_{\text{batch}}^k = \frac{1}{m} \sum_{i=1}^m H_i^k$$
$$\sigma_{\text{batch}}^k = \sqrt{\delta + \frac{1}{m} \sum_{i=1}^m (H_i^k - \mu_{\text{batch}}^k)^2}$$

批标准化 BN

批标准化 (Batch Normalization, BN)

- ✓ 为每个卷积核引入可训练参数 γ 和 β ，调整批归一化的力度。

$$X_i^k = \gamma_k H_i'^k + \beta_k$$

↑ ↑
缩放因子 偏移因子

批标准化

BN

批标准化 (Batch Normalization, BN)

✓ BN层位于卷积层之后，激活层之前。

卷积

Convolutional

批标准化

BN

激活

Activation

✓ TF描述批标准化

`tf.keras.layers.BatchNormalization()`

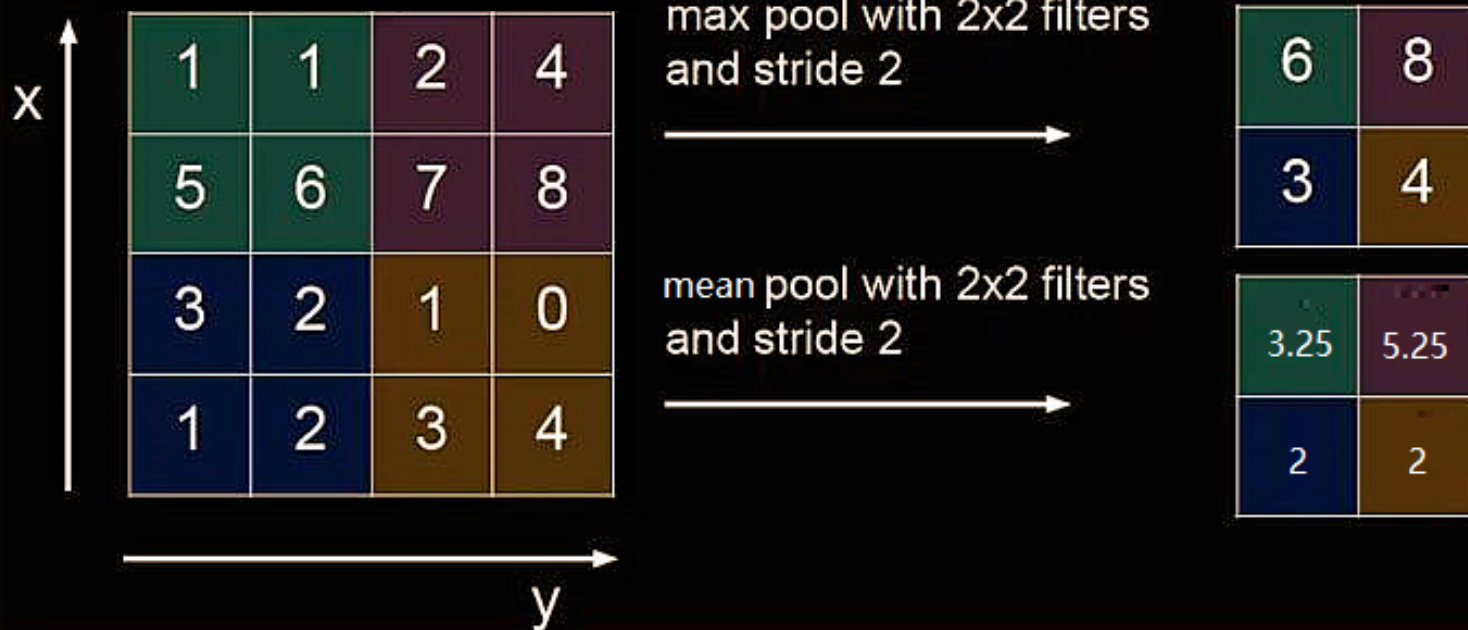

```
model = tf.keras.models.Sequential([
    Conv2D(filters=6, kernel_size=(5, 5), padding='same'), # 卷积层
    BatchNormalization(), # BN层
    Activation('relu'), # 激活层
    MaxPool2D(pool_size=(2, 2), strides=2, padding='same'), # 池化层
    Dropout(0.2), # dropout层
])
```

池化

Pooling

池化用于减少特征数据量。

最大值池化可提取图片纹理，均值池化可保留背景特征。

✓ TF描述池化

`tf.keras.layers.MaxPool2D(`

pool_size=池化核尺寸，#正方形写核长整数，或（核高h，核宽w）
strides=池化步长，#步长整数，或(纵向步长h，横向步长w)，默认为pool_size
padding=‘valid’or‘same’ #使用全零填充是“same”，不使用是“valid”（默认）
)

`tf.keras.layers.AveragePooling2D(`

pool_size=池化核尺寸，#正方形写核长整数，或（核高h，核宽w）
strides=池化步长，#步长整数，或(纵向步长h，横向步长w)，默认为pool_size
padding=‘valid’or‘same’ #使用全零填充是“same”，不使用是“valid”（默认）
)

```
model = tf.keras.models.Sequential([  
    Conv2D(filters=6, kernel_size=(5, 5), padding='same'), # 卷积层  
    BatchNormalization(), # BN层  
    Activation('relu'), # 激活层  
    MaxPool2D(pool_size=(2, 2), strides=2, padding='same'), # 池化层  
    Dropout(0.2), # dropout层  
])
```

舍弃 Dropout

在神经网络训练时，将一部分神经元按照一定概率从神经网络中暂时舍弃。神经网络使用时，被舍弃的神经元恢复链接。

✓ TF描述池化

tf.keras.layers.Dropout(舍弃的概率)

```
model = tf.keras.models.Sequential([  
    Conv2D(filters=6, kernel_size=(5, 5), padding='same'), # 卷积层  
    BatchNormalization(), # BN层  
    Activation('relu'), # 激活层  
    MaxPool2D(pool_size=(2, 2), strides=2, padding='same'), # 池化层  
    Dropout(0.2), # dropout层  
)
```

✓ 卷积神经网络：借助卷积核提取特征后，送入全连接网络。

卷积神经网络网络的主要模块

卷积是什么？ 卷积就是特征提取器，就是**CBAPD**

```
model = tf.keras.models.Sequential([  
C Conv2D(filters=6, kernel_size=(5, 5), padding='same'), # 卷积层  
B BatchNormalization(), # BN层  
A Activation('relu'), # 激活层  
P MaxPool2D(pool_size=(2, 2), strides=2, padding='same'), # 池化层  
D Dropout(0.2), # dropout层  
])
```

✓ **Cifar10数据集:**

提供 5万张 32×32 像素点的十分类彩色图片和标签，用于训练。

提供 1万张 32×32 像素点的十分类彩色图片和标签，用于测试。

✓ 导入cifar10数据集:

```
cifar10 = tf.keras.datasets.cifar10
```

```
(x_train, y_train), (x_test, y_test) = cifar10.load_data()
```

✓ `plt.imshow(x_train[0])` #绘制图片
`plt.show()`

✓ `print("x_train[0]:\n" , x_train[0])`
`x_train[0]:`

```
[[[ 59  62  63]
 [ 43  46  45]
 [ 50  48  43]
 [ 68  54  42]
 [ 98  73  52]
 [119  91  63]
 [139 107  75]
 [145 110  80]
 [149 117  89]
 [149 120  93]
 [131 103  77]
 [125  99  76]
```

✓ `print("y_train[0]:", y_train[0])`
`y_train[0]: 6`

✓ `print("x_test.shape:", x_test.shape)`
`x_test.shape: (10000, 32, 32, 3)`

经典卷积网络

ResNet诞生于2015年，当年ImageNet竞赛冠军，Top5错误率为3.57%

Kaiming He, Xiangyu Zhang, Shaoqing Ren. Deep Residual Learning for Image Recognition. In CPVR, 2016.

ResNet

网络层数加深提高识别准确率

| 模型名称 | 网络层数 |
|-----------------|---------|
| LeNet | 5 |
| AlexNet | 8 |
| VGG | 16 / 19 |
| InceptionNet v1 | 22 |

训练集误差图

校验集误差图

56层卷积网络错误率高于与20层卷积网络

ResNet块

Inception块中的“+”是沿深度方向叠加（千层蛋糕层数叠加）

ResNet块中的“+”是特征图对应元素值相加（矩阵值相加）

ResNet块

虚线表示维度不同，
计算方式为 $H(x)=F(x)+W(x)$ ，
其中 W 是 $1*1$ 卷积操作，调整 x 的维度

实线表示维度相同，
计算方式为 $H(x)=F(x)+x$

1*1卷积操作可通过步长改变特征图尺寸，通过卷积核个数改特征图深度

ResNet块

```
class ResnetBlock(Model):

    def __init__(self, filters, strides=1, residual_path=False):
        super(ResnetBlock, self).__init__()
        self.filters = filters

经典卷积网络

AlexNet:

使用relu激活函数，提升训练速度；
使用Dropout，缓解过拟合

InceptionNet:

一层内使用不同尺寸卷积核，提升感知力
使用批标准化，缓解梯度消失

LeNet:

卷积网络开篇之作，
共享卷积核，减少网络参数

VGGNet:

小尺寸卷积核减少
参数，网络结构规
整，适合并行加速

ResNet:

层间残差跳连，
引入前方信息，
缓解模型退化，
使神经网络层数
加深成为可能
